Asymptotic solutions of scalar integro-differential equations with partial derivatives and with rapidly oscillating coefficients

The work is devoted to the development of an asymptotic integration algorithm for the Cauchy problem for a singularly perturbed partial differential integro-differential equation with rapidly oscillating coefficients, which describe various physical processes in micro-inhomogeneous media. This direction in the theory of partial differential equations is developing intensively and finds numerous applications in radiophysics, electrical engineering, filtering theory, phase transition theory, elasticity theory, and other branches of physics, mechanics, and technology. For studies of such processes, asymptotic methods are usually used. It is known that currently rapidly developing numerical methods do not exclude asymptotic. This happens for a number of reasons. Firstly, a reasonably constructed asymptotics, especially its main term, carries information that is important for applications about the qualitative behavior of the solution and, in this sense, to some extent replaces the exact solution, which most often cannot be found. Secondly, as follows from the above, knowledge of the solution structure helps in the development of numerical methods for solving complex problems; therefore, the development of asymptotic methods contributes to the development of numerical methods. Regularization of the problem is carried out, the normal and unique solvability of general iterative problems is proved.

Keywords: singularly perturbed, partial integro differential equation, regularization of an integral, solvability of iterative problems.

Introduction

A mathematical description of physical processes in micro-inhomogeneous media suggests that the local characteristics of the latter depend on a small parameter which is a characteristic scale of the microstructure of the medium. To construct mathematical models of such processes, an asymptotic analysis of the problem is performed. It turns out that the limits of the solutions to the problem are described by some new differential equations that have relatively smoothly varying coefficients and are considered in simple domains. These equations are mathematical models of physical processes in micro-inhomogeneous media, and their coefficients are effective characteristics of such media. For mathematical studies of such processes, asymptotic methods are usually used. It is known that currently rapidly developing numerical methods do not exclude asymptotic ones. This happens for a number of reasons. Firstly, a reasonably constructed asymptotics, especially its main term, carries information that is important for applications about the qualitative behavior of the solution and, in this case to some extent replaces the exact solution, which most often cannot be found. Secondly, as follows from the above, knowledge of the solution structure helps in the development of numerical methods for solving complex problems; therefore, the development of asymptotic methods contributes to the development of numerical methods. Thirdly, for some problems, especially those related to fast oscillations, there are simply no effective numerical methods that give a sufficient degree of accuracy. The first of the problems with an irregular dependence in perturbation theory that arose in connection with the problems of celestial mechanics and electrical engineering were nonlinear equations, which are often called oscillating equations at present. Tasks of this kind arise everywhere where certain transient processes take place. Studies of oscillating and singularly perturbed oscillating systems described by ordinary differential equations to the splitting methods were carried out in [1–4] and regularization methods in [5–8]. An analysis of the main results of the study for systems of homogeneous and inhomogeneous differential equations prompted the idea to study singularly perturbed integro-differential equations with rapidly oscillating coefficients. A system of integro-differential equations in the absence of resonance is considered, i.e. when the integer linear combination of frequencies of the rapidly oscillating cosine does not coincide with the frequency of the spectrum of the limit operator [9, 10]. It should be
noted that when developing an algorithm for constructing an asymptotic solution to the problem, the ideas of the regularization method used to study ordinary integro-differential equations [11–21] and integro-differential equations with partial derivatives [23–24] were used.

We consider the Cauchy problem for the integro-differential equation with partial derivatives:

\[
\varepsilon \frac{\partial y(x,t,\varepsilon)}{\partial x} = a(x)g(y(t)) + \int_{x_0}^{x} K(x,t,s)g(y(t))ds + h(x,t) + \\
+ \varepsilon g(x)\cos\beta(x) = 0, \quad y(x_0,t,\varepsilon) = y_0(t) \quad ((x,t) \in [x_0, X] \times [0,T]),
\]

where \(\beta'(x) > 0, g(x), a(x)\) is a scalar function, \(y_0(t)\) constant, \(\varepsilon > 0\) is a small parameter. Denote by \(\lambda_1(x) = -a(x), \beta'(x)\) is a frequency of rapidly oscillating cosine. In the following, functions \(\lambda_2(x) = -i\beta'(x), \lambda_3(x) = +i\beta'(x)\) will be called the spectrum of a rapidly oscillating coefficient.

We assume that the conditions are fulfilled:

(i) \(a(x), g(x), \beta(x) \in C^\infty[x_0, X]; h(x,t) \in C^\infty[x_0, X] \times [0,T]\), the kernel \(K(x,t,s)\) belongs to the space \(K(x,t,s) \in C^\infty[x_0 < x < s < X, 0 < t < T]\);

(ii) \(\lambda_1(x) \equiv a(x) \neq \lambda_j(x), \quad j = 2, 3, \quad \lambda_i(x) \neq 0, (\forall x \in [x_0, X]), \quad i = 1, 2, 3;\)

(iii) \(\lambda_1(x) \leq 0, (\forall x \in [x_0, X]);\)

(iv) for \(\forall x \in [x_0, X]\) and \(n_2 \neq n_3\) inequalities

\[
n_2\lambda_2(x) + n_3\lambda_3(x) \neq \lambda_1(x),
\]

\[
\lambda_1(x) + n_2\lambda_2(x) + n_3\lambda_3(x) \neq \lambda_1(x), \quad (\forall x \in [x_0, X])
\]

for all multi-indices \(n = (n_2, n_3)\) with \(|n| \equiv n_2 + n_3 \geq 1, (n_2\) and \(n_3\) are non-negative integers) are holds.

We will develop an algorithm for constructing a regularized [5] asymptotic solution of problem (1).

1 Regularization of problem (1)

Denote by \(\sigma_j = \sigma_j(\varepsilon), \) independent of \(t\) magnitudes \(\sigma_1 = e^{-\frac{i}{2\varepsilon}\beta(t)}, \sigma_1 = e^{\frac{i}{2\varepsilon}\beta(t)}, \) and rewrite system (1) as

\[
\varepsilon \frac{\partial y(x,t,\varepsilon)}{\partial x} - \lambda_1(x)y(x,t,\varepsilon) - \varepsilon \frac{\partial y(t)}{\partial x} \left( e^{-\frac{i}{2\varepsilon}\beta(t)}\sigma_1 + e^{\frac{i}{2\varepsilon}\beta(t)}\sigma_2 \right) y(x,t,\varepsilon) - \\
- \int_{x_0}^{x} K(x,t,s)g(y(t),t,\varepsilon)ds = h(x,t), \quad y(x_0,t,\varepsilon) = y_0, \quad ((x,t) \in [x_0, X] \times [0,T]).
\]

We introduce regularizing variables (see [5, 6]):

\[
\tau_j = \frac{1}{\varepsilon} \int_{x_0}^{x} \lambda_j(\varepsilon) \frac{d\theta}{\varepsilon}, \quad j = 1, 3,
\]

and instead of problem (2), consider the problem

\[
\varepsilon \frac{\partial \tilde{y}}{\partial x} + \sum_{j=1}^{3} \lambda_j(t) \frac{\partial \tilde{y}}{\partial \tau_j} - \lambda_1(x)\tilde{y} - \varepsilon \frac{\partial \tilde{y}(t)}{\partial x} \left( e^{\tau_1}+e^{\tau_2}\sigma_1 \right) \tilde{y} - \\
- \int_{x_0}^{x} K(x,t,s)\tilde{y}(s,t,\varepsilon)ds = h(x,t), \quad \tilde{y}(x_0,t,\varepsilon) = y_0, \quad ((x,t) \in [x_0, X] \times [0,T]),
\]

for the function \(\tilde{y} = \tilde{y}(x,t,\tau,\varepsilon)\), where is indicated: \(\tau = (\tau_1, \tau_2, \tau_3), \) \(\psi = (\psi_1, \psi_2, \psi_3).\) It is clear that if \(\tilde{y} = \tilde{y}(x,t,\tau,\varepsilon)\) is a solution to problem (3), then the vector function \(y = \tilde{y} \left( x, \psi(\varepsilon) \right) \) is an exact solution to problem (2), therefore, problem (3) is extended with respect to problem (2). However, it cannot be considered fully regularized, since it does not regularize the integral term \(J\tilde{y} = \int_{x_0}^{x} K(x,t,s)\tilde{y}(s,\psi(\varepsilon))ds.\) To regularize the integral operator, we introduce a class \(M_{L}\) that is asymptotically invariant with respect to the operator \(J\tilde{y}\) (see [5], p. 62). Recall the corresponding concept.

Definition 1. A class \(M_{L}\) is said to be asymptotically invariant (with \(\varepsilon \to +0\)) with respect to an operator \(P_0\) if the following conditions are fulfilled:

1) \(M_{L} \subset D(P_0)\) with each fixed \(\varepsilon > 0;\)

2) the image \(P_0g(x,\varepsilon)\) of any element \(g(x,\varepsilon) \in M_{L}\) decomposes in a power series

\[
P_0g(x,\varepsilon) = \sum_{n=0}^{\infty} e^{n}g_n(x,\varepsilon)(\varepsilon \to +0, g_n(x,\varepsilon) \in M_{L}, n = 0, 1, \ldots),
\]

convergent asymptotically for \(\varepsilon \to +0\) (uniformly with \(x \in [x_0, X]\).)
From this definition it can be seen that the class $M_{\varepsilon}$ depends on the space $U$, in which the operator $P_0$ is defined. In our case $P_0 = J$. For the space $U$ we take the space of vector functions $y(x, t, \tau)$, represented by sums

$$y(x, t, \tau, \sigma) = y_0(x, t, \sigma) + \sum_{i=1}^{3} y_i(x, t, \sigma) e^{\tau i} + \sum_{2 \leq |m| \leq N_0}^{*} y^m(x, t, \sigma) e^{(m, \tau)} +$$

$$+ \sum_{1 \leq |m| \leq N_0}^{*} y^{1+m}(x, t, \epsilon e^{1+m, \tau}) y_i(x, t, \sigma), y^m(x, t, \sigma), y^{1+m}(x, t, \sigma) \in C^\infty[x_0, X] \times [0, T],$$

$$m = (0, m_2, m_3), 1 \leq |m| \equiv m_2 + m_3 \leq N_0, i = \overline{1,3},$$

where is denoted: $\lambda(x) \equiv (\lambda_1, \lambda_2, \lambda_3)$, $(m, \lambda(x)) \equiv m_2 \lambda_2(x) + m_3 \lambda_3(x)$, $(\epsilon_1 + m, \lambda(x)) \equiv \lambda_1(x) + m_2 \lambda_2(x) + m_3 \lambda_3(x)$; an asterisk * above the sum sign indicates that the summation for $|m| \geq 1$ it occurs only over multi-indices $m = (0, m_2, m_3)$ with $m_2 \neq m_3$, $e_1 = (1, 0, 0)$, $\sigma = (\sigma_1, \sigma_2)$.

Note that here the degree $N_0$ of the polynomial $y(x, t, \tau, \sigma)$ relative to the exponentials $e^{\tau i}$ depends on the element $y$. In addition, the elements of space $U$ depend on bounded in $\varepsilon > 0$ terms of constants $\sigma_1 = \sigma_1(\varepsilon)$ and $\sigma_2 = \sigma_2(\varepsilon)$, and which do not affect the development of the algorithm described below, therefore, in the record of element $4$ of this space $U$, we omit the dependence on $\sigma = (\sigma_1, \sigma_2)$ for brevity. We show that the class $M_{\varepsilon} = U|_{\tau=\psi(t)/\varepsilon}$ is asymptotically invariant with respect to the operator $J$. The image of the operator on the element $4$ of space $U$ has the form

$$J y(x, t, \tau, \sigma) = \int_{x_0}^{x} K(x, t, s) y_0(s, t) ds + \sum_{i=1}^{3} \int_{x_0}^{x} K(x, t, s) y_i(s, t) e^{\tau i} ds +$$

$$+ \sum_{2 \leq |m| \leq N_0}^{*} \int_{x_0}^{x} K(x, t, s) y^m(s, t) e^{(m, \tau)} ds + \sum_{1 \leq |m| \leq N_0}^{*} \int_{x_0}^{x} K(x, t, s) y^{1+m}(s, t) e^{(1+m, \tau)} ds.$$
are satisfied. In addition, for the same multi-indices \( m = (0, m_2, m_3) \) we have
\[
(e_1 + m, \lambda(x)) \neq 0 \quad \forall x \in [x_0, X], \quad m_2 \neq m_3, \quad |m| = m_2 + m_3 \geq 1.
\]

Indeed, if \( (e_1 + m, \lambda(x)) = 0 \) for some \( x \in [x_0, X] \) and \( m_2 \neq m_3, \quad m_2 + m_3 \geq 1, \) then \( m_2 \lambda_2(x) + m_3 \lambda_3(x) = -\lambda_1(x), \quad m_2 + m_3 \geq 1, \) which contradicts condition (iv). Therefore, integration by parts in integrals is possible. Performing it, we will have:

\[
J_m(x, t, \varepsilon) = \int_{t_0}^{x} K(x, t, s) y^{m}(s, t) e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (m, \lambda') d\theta} ds = \varepsilon \int_{x_0}^{x} \frac{K(x, t, s) y^{m}(s, t)}{(m, \lambda(s))} \frac{1}{\varepsilon} \int_{s_0}^{s} (m, \lambda') d\theta \quad = \\
\varepsilon \left[ K(x, t, x) y^{m}(x, t) e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (m, \lambda') d\theta} - \int_{x_0}^{x} \frac{\partial}{\partial s} \frac{K(x, t, s) y^{m}(s, t)}{(m, \lambda(s))} e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (m, \lambda') d\theta} ds \right] \\
- \int_{x_0}^{x} \left( \frac{\partial}{\partial s} K(x, t, s) y^{m}(s, t) \right) e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (m, \lambda') d\theta} ds.
\]

Therefore, the image of the operator \( J \) on the element (4) of the space \( U \) is represented as a series

\[
J z (t, \tau) = \int_{t_0}^{t} K(t, s) z_0(s) ds + \sum_{\nu = 1}^{\infty} \int_{x_0}^{x} \left( I_{\nu}^{m}(K(t, s) z_0(s)) \right)_{s=t} e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (m, \lambda') d\theta} - \\
- (I_{\nu}^{m}(K(t, s) z_1(s)))_{s=t} + \sum_{\nu = 0}^{\infty} \sum_{j=1}^{\nu} (-1)^{\nu} e^{\nu+1} \left( I_{\nu}^{m}(K(t, s) z^m(s)) \right)_{s=t} e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (m, \lambda') d\theta} \\
- (I_{\nu}^{m}(K(t, s) z^{m}(s)))_{s=t} + \sum_{\nu = 1}^{\infty} \sum_{j=1}^{\nu} (-1)^{\nu} e^{\nu+1} \left( I_{\nu}^{m}(K(t, s) z^{w+j}_{\nu}(s)) \right)_{s=t} - \\
\times e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (e_j + m, \lambda_{\nu}(s))} - (I_{\nu}^{m}(K(t, s) z^{w+j}_{\nu}(s)))_{s=t},
\]

Continuing this process, we obtain the series

\[
J_{e_1 + m}(x, t, \varepsilon) = \sum_{\nu = 0}^{\infty} (-1)^{\nu} e^{\nu+1} \left[ (I_{\nu}^{m}(K(x, t, s) y^{e_1 + m}(s, t)))_{s=t} e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (e_1 + m, \lambda') d\theta} - \\
- (I_{\nu}^{m}(K(x, t, s) y^{e_1 + m}(s, t)))_{s=t} \right],
\]

\[
J_{e_1 + m}^{0} = \frac{1}{(m, \lambda(s))}, \quad J_{e_1 + m}^{nu} = \frac{1}{(m, \lambda(s))} \frac{\partial}{\partial s} f_{(m, \lambda(s))}^{nu-1} (\nu \geq 1, |m| \geq 2),
\]

\[
J_{e_1 + m}(x, t, \varepsilon) = \int_{x_0}^{x} K(x, t, s) y^{e_1 + m}(s, t) e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (e_1 + m, \lambda') d\theta} ds = \\
= \int_{s_0}^{x} K(x, t, s) y^{e_1 + m}(s, t) e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (e_1 + m, \lambda') d\theta} ds = \\
= \int_{s_0}^{x} \left( \frac{\partial}{\partial s} K(x, t, s) y^{e_1 + m}(s, t) \right) e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (e_1 + m, \lambda') d\theta} ds \\
- \int_{x_0}^{x} \left( \frac{\partial}{\partial s} K(x, t, s) y^{e_1 + m}(s, t) \right) e^{\frac{1}{\varepsilon} \int_{s_0}^{s} (e_1 + m, \lambda') d\theta} ds.
\]
with respect to the operator law:

$$J_{e_1+m}(x, t, \varepsilon) = \sum_{\nu=0}^{\infty} (-1)^\nu \varepsilon^{\nu+1} \left[ (I_{e_1+m}^\nu (K(x, t, s)y^{(e_1+m)}(s, t)))_{s=0} e^\frac{1}{2} \int_{0}^{x} (e_1+m, \lambda(\theta)) d\theta \right].$$

Continuing this process, we obtain the series

$$J_{e_1+m}(x, t, \varepsilon) = \sum_{\nu=0}^{\infty} (-1)^\nu \varepsilon^{\nu+1} \left[ (I_{e_1+m}^\nu (K(x, t, s)y^{(e_1+m)}(s, t)))_{s=0} e^\frac{1}{2} \int_{0}^{x} (e_1+m, \lambda(\theta)) d\theta \right].$$

Therefore, the image of the operator \( J \) on the element (4) of the space \( U \) is represented as a series

$$Jy(x, t, \tau) = \int_{x_0}^{x} K(x, t, s)y_0(s, t)ds + \sum_{i=1}^{3} \sum_{\nu=0}^{\infty} (-1)^\nu \varepsilon^{\nu+1} \left[ (I_{m}^\nu (K(x, t, s)y^{m}(s, t)))_{s=x_0} e^\frac{1}{2} \int_{0}^{x} (m, \lambda(\theta)) d\theta \right] - (I_{m}^\nu (K(x, t, s)y^{m}(s, t)))_{s=x_0} +$$

$$+ \sum_{2 \leq |m| \leq N_y} \sum_{\nu=0}^{\infty} (-1)^\nu \varepsilon^{\nu+1} \left[ (I_{e_1+m}^\nu (K(x, t, s)y^{(e_1+m)}(s, t)))_{s=x_0} e^\frac{1}{2} \int_{0}^{x} (e_1+m, \lambda(\theta)) d\theta \right] - (I_{e_1+m}^\nu (K(x, t, s)y^{(e_1+m)}(s, t)))_{s=x_0} +$$

It is easy to show (see, for example, [25], pp. 291-294) that this series converges asymptotically for \( \varepsilon \to +0 \) (uniformly in \( (x, t) \in [x_0, X] \times [0, T] \)). This means that the class \( M_\varepsilon \) is asymptotically invariant (for \( \varepsilon \to +0 \)) with respect to the operator \( J \).

We introduce operators \( R_\nu : U \to U \), acting on each element \( y(x, t, \tau) \in U \) of the form (4) according to the law:

$$R_0 y(x, t, \tau) = \int_{x_0}^{x} K(x, t, s)y_0(s, t)ds,$$

$$R_1 y(x, t, \tau) = \sum_{i=1}^{3} \left[ (I_{m}^0 (K(x, t, s)y_0(s, t)))_{s=x} e^{\tau_i} - (I_{m}^0 (K(x, t, s)y_0(s, t)))_{s=x_0} \right] +$$

$$+ \sum_{1 \leq |m| \leq N_y} \left[ (I_{e_1+m}^0 (K(x, t, s)y^{(e_1+m)}(s, t)))_{s=x} e^{(e_1+m, \tau)} - (I_{e_1+m}^0 (K(x, t, s)y^{(e_1+m)}(s, t)))_{s=x_0} \right],$$

$$R_{\nu+1} y(x, t, \tau) = \sum_{i=1}^{3} \left[ (I_{m}^\nu (K(x, t, s)y(s, t)))_{s=x} e^{\tau_i} - (I_{m}^\nu (K(x, t, s)y_0(s, t)))_{s=x_0} \right] +$$

$$+ \sum_{2 \leq |m| \leq N_y} \left[ (I_{e_1+m}^\nu (K(x, t, s)y^{(e_1+m)}(s, t)))_{s=x} e^{(e_1+m, \tau)} - (I_{e_1+m}^\nu (K(x, t, s)y^{(e_1+m)}(s, t)))_{s=x_0} \right], \quad \nu \geq 1.$$
Now let \( \tilde{g}(x,t,\tau,\varepsilon) \) be an arbitrary continuous function on \((x,t,\tau) \in [x_0, X] \times [0,T] \times \{Re\lambda_1(x)\} \) with asymptotic expansion

\[
\tilde{g}(x,t,\tau,\varepsilon) = \sum_{k=0}^{\infty} \varepsilon^k y_k(x,t,\tau), \quad y_k(x,t,\tau) \in U,
\]

converging as \( \varepsilon \to +0 \) (uniformly in \((x,t,\tau) \in [x_0, X] \times [0, T] \times \{Re\lambda_1(x)\})

Then the image \( J\tilde{g}(x,t,\tau,\varepsilon) \) of this function is decomposed into an asymptotic series

\[
J\tilde{g}(x,t,\tau,\varepsilon) = \sum_{k=0}^{\infty} \varepsilon^k Jy_k(x,t,\tau) = \sum_{r=0}^{\infty} \varepsilon^r \sum_{s=0}^{r} R_{r-s}y_s(x,t,\tau) |_{\tau=\psi(x)/\varepsilon}.
\]

This equality is the basis for introducing an extension of an operator \( J \) on series of the form (6):

\[
\tilde{J}\tilde{g}(x,t,\tau,\varepsilon) = \sum_{k=0}^{\infty} \varepsilon^k \tilde{J}y_k(x,t,\tau) \equiv \tilde{J} \left( \sum_{k=0}^{\infty} \varepsilon^k y_k(x,t,\tau) \right) \equiv \sum_{r=0}^{\infty} \varepsilon^r \sum_{s=0}^{r} R_{r-s}y_s(x,t,\tau).
\]

Although the operator \( \tilde{J} \) is formally defined, its utility is obvious, since in practice it is usual to construct the \( N \)-th approximation of the asymptotic solution of the problem (2), in which impose only \( N \)-th partial sums of the series (6), which have not a formal, but a true meaning. Now you can write a problem that is completely regularized with respect to the original problem (2):

\[
L_\varepsilon \tilde{g}(x,t,\tau,\varepsilon) \equiv \varepsilon \frac{\partial g}{\partial \tau} + \sum_{j=1}^{3} \lambda_j(x) \frac{\partial y_j}{\partial \tau} - \lambda_1(x)y_0 - R_0y_0 = h(x,t), y_0(x_0,t,0) = y_0(t),
\]

Solvability of iterative problems

Substituting the series (6) into (7) and equating the coefficients with the same degrees \( \varepsilon \), we obtain the following iterative problems:

\[
L_{y_0}(x,t,\tau) \equiv \sum_{j=1}^{3} \lambda_j(x) \frac{\partial y_0}{\partial \tau} - \lambda_1(x)y_0 - R_0y_0 = h(x,t), y_0(x_0,t,0) = y_0(t); \quad (8_0)
\]

\[
L_{y_1}(x,t,\tau) = - \frac{\partial y_0}{\partial x} + \frac{g(x)}{2} \left( e^{\varepsilon_2 \sigma_1 + \varepsilon_3 \sigma_2} y_0 + R_1y_0, y_1(x_0,t,0) = 0; \quad (8_1)
\]

\[
L_{y_2}(x,t,\tau) = - \frac{\partial y_1}{\partial x} + \frac{g(x)}{2} \left( e^{\varepsilon_2 \sigma_1 + \varepsilon_3 \sigma_2} y_0 + R_1y_1 + R_2y_0, y_0(x_0,t,0) = 0; \quad (8_2)
\]

\[
L_{y_k}(x,t,\tau) = - \frac{\partial y_{k-1}}{\partial x} + \frac{g(x)}{2} \left( e^{\varepsilon_2 \sigma_1 + \varepsilon_3 \sigma_2} y_{k-1} + R_ky_0 + \ldots + R_1y_{k-1}, y_k(x_0,t,0) = 0, k \geq 1. \quad (8_k)
\]

Each of the iterative problems (8_k) can be written as

\[
L_{z}(x,t,\tau) \equiv \sum_{j=1}^{3} \lambda_j(x) \frac{\partial z}{\partial \tau} - \lambda_1(x)y - R_0y = h(x,t,\tau), y(x_0,t,0) = y^*, \quad (9)
\]

where

\[
h(x,t,\tau) = h_0(x,t) + \sum_{i=1}^{3} h_i(x,t) e^{\varepsilon_1 + \sum_{2 \leq |m| \leq N_y} h^m(x,t) e^{(m,\tau)} + \sum_{1 \leq |m| \leq N_y} h^{e_1+m}(x,t) e^{(e_1+m,\tau)} \in U,
\]

is the known vector function of space \( U \), \( y^* \) is the known constant vector of the complex space \( C \), and the operator \( R_0 \) has the form (see (5_0))

\[
R_0y(x,t,\tau) \equiv R_0 \left[ y_0(x,t) + \sum_{i=1}^{3} y_i(x,t) e^{\varepsilon_1 + \sum_{2 \leq |m| \leq N_y} y^m(x,t) e^{(m,\tau)} + \sum_{1 \leq |m| \leq N_y} y^{e_1+m}(x,t) e^{(e_1+m,\tau)} \Delta \right]
\]

\[
\Delta = \int_{x_0}^{x} K(x,t,s) y_0(s,t) ds.
\]
The equation (11) can be written as
\[ y(x, t, \tau) = y_0(x, t) + \sum_{i=1}^{3} y_i(x, t)e^{\tau_i} + \sum_{2 \leq |m| \leq N} y^m(x, t)e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_H} y^{e_1+m}(x, t)e^{(e_1+m, \tau)} = y_0(x, t) + \sum_{i=1}^{3} y_i(x, t)e^{\tau_i} + \sum_{2 \leq |m| \leq N} y^m(x, t)e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_H} y^{m^1}(x, t)e^{(m^1, \tau)}, \] (10)
where for convenience introduced multi-indices
\[ m^1 = e_1 + m \equiv (1, m_2, m_3), \quad |m^1| = 1 + m_2 + m_3 \geq 2, \]
m_2 and m_3 are non-negative integer numbers. Substituting (10) into equation (9), and equating here the free terms and coefficients separately for identical exponents, we obtain the following equations:
\[ -\lambda_1(x)y_0(x, t) - \int_{x_0}^{x} K(x, t, s)y_0(s, t)ds = h_0(x, t), \] (11)
\[ [\lambda_i(x) - \lambda_1(x)]y_i(x, t) = h_i(x, t), \quad i = 1, 2, 3, \] (11i)
\[ [(m, \lambda(x)) - \lambda_1(x)]y^m(x, t) = h^m(x, t), \quad m_2 \neq m_3, \quad 2 \leq |m| \leq N_h, \] (11m)
\[ [(m^1, \lambda(x)) - \lambda_1(x)]y^{m^1}(x, t) = h^{m^1}(x, t), \quad m_2 \neq m_3, \quad 1 \leq |m^1| \leq N_h. \] (12)
The equation (11) can be written as
\[ y_0(x, t) = \int_{t_0}^{t} (-\lambda_1^{-1}(x)K(x, t, s))y_0(s, t)ds - \lambda_1^{-1}(x)h_0(x, t). \] (11a)
Due to the smoothness of the kernel \(-\lambda_1^{-1}(x)K(x, t, s)\) and heterogeneity \(-\lambda_1^{-1}(x)h_0(x, t)\), this Volterra integral system has a unique solution \(y_0(x, t) \in C^{\infty}[x_0, X] \times [0, T]\). The equations (11i) - (11m) also have unique solutions
\[ y_i(x, t) = [\lambda_i(x) - \lambda_1(x)]^{-1}h_i(x, t) \in C^{\infty}[x_0, X] \times [0, T], \quad i = 2, 3, \]
\[ y^m(x, t) = [(m, \lambda(x)) - \lambda_1(x)]^{-1}h^m(x, t) \in C^{\infty}[x_0, X] \times [0, T], \quad 2 \leq |m| \leq N_h, \]
\[ y^{m^1}(x, t) = [(m^1, \lambda(x)) - \lambda_1(x)]^{-1}h^{m^1}(x, t), \quad 1 \leq |m^1| \leq N_h, \]
which cannot be (see definition of class \(U\)). Thus, equation (12) for \(|m^1| \geq 1\) has a unique solution
\[ z^{m^1}(x, t) = [(m^1, \lambda(x)) - \lambda_1(x)]^{-1}h^{m^1}(x, t), \quad 1 \leq |m^1| \leq N_h, \]
in class \(C^{\infty}[x_0, X] \times [0, T]\).
We have proved the following statement.

**Theorem 1.** Let conditions (i)-(ii), (iv) be fulfilled and the right-hand side
\[ h(x, t, \tau) = h_0(x, t) + \sum_{i=1}^{3} h_i(x, t)e^{\tau_i} + \sum_{2 \leq |m| \leq N} h^m(x, t)e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_H} h^{e_1+m}(x, t)e^{(e_1+m, \tau)} \in U \]

of equation (9) belongs to the space $U$. Then, for the solvability of equation (9) in space $U$, it is necessary and sufficient that condition (13) is satisfied.

Under constraint (13), equation (9) has the following solution in space $U$:

$$
g(x, t, \tau) = g_0(x, t) + \xi(x, t)e^{\tau_1} + \sum_{i=2}^{3} \left[ \lambda_i(x) - \lambda_1(x) \right]^{-1} H_i(x, t)e^{\tau_i} + \sum_{2 \leq |m| \leq N_H} \left[ (m, \lambda(x)) - \lambda_1(x) \right]^{-1} H^m(x, t)e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_H} \left[ (m^1, \lambda(x)) - \lambda_1(x) \right]^{-1} H^{e_1 + m}(x, t)e^{(e_1 + m, \tau)}, \tag{14}\$$

where $\xi(x, t) \in C^\infty[x_0, X] \times [0, T]$ are arbitrary function, $g_0(x, t)$ is the solution of an integral equation (110), $m \equiv (0, m_2, m_3), m_2 \neq m_3, |m| = m_2 + m_3 \geq 1$.

Subject the solution (14) to the initial condition $g(x_0, t_0) = g_*(t)$. Then we have

$$\xi(x_0, t) = \lambda_1^{-1}(x_0)h_0(x_0, t) + \sum_{i=2}^{3} \left[ \lambda_i(x_0) - \lambda_1(x_0) \right]^{-1} h_i(x_0, t) + \sum_{2 \leq |m| \leq N_H} \left[ (m, \lambda(x_0)) - \lambda_1(x_0) \right]^{-1} h^m(x_0, t) + \sum_{1 \leq |m| \leq N_H} \left[ (m^1, \lambda(x_0)) - \lambda_1(x_0) \right]^{-1} h^{e_1 + m}(x_0, t), \tag{15}\$$

However, the functions $\xi(x, t)$ were not found completely. An additional requirement is required to solve problem (13). Such a requirement is dictated by iterative problems (8k), from which it can be seen that the natural additional constraint is the condition

$$-\frac{\partial u}{\partial x} + \frac{g(x)}{2}(e^{\tau_2} + e^{\tau_1})y + R_1y + p(x, t, \tau) \equiv 0, \quad (\forall (x, t) \in [x_0, X] \times [0, T]), \tag{16}\$$

where $p(x, t, \tau) = p_0(x, t) + \sum_{i=1}^{3} p_i(x, t)e^{\tau_i} + \sum_{2 \leq |m| \leq N_H} p^m(x, t)e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_H} p^{e_1 + m}(x, t)e^{(e_1 + m, \tau)} \in U$ is the known vector-function. The right part of this equation:

$$G(x, t, \tau) \equiv -\frac{\partial y}{\partial t} + \frac{g(x)}{2}(e^{\tau_2} \sigma_1 + e^{\tau_1} \sigma_2) y + Q(x, t, \tau) =$$

$$= -\frac{\partial}{\partial x} \left[ y_0(x, t) + \sum_{i=1}^{3} y_i(x, t)e^{\tau_i} + \sum_{2 \leq |m| \leq N_H} y^m(x, t)e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_H} y^{e_1 + m}(x, t)e^{(e_1 + m, \tau)} \right] + \frac{g(x)}{2}(e^{\tau_2} \sigma_1 + e^{\tau_1} \sigma_2) \left[ y_0(x, t) + \sum_{i=1}^{3} y_i(x, t)e^{\tau_i} + \sum_{2 \leq |m| \leq N_H} y^m(x, t)e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_H} y^{e_1 + m}(x, t)e^{(e_1 + m, \tau)} \right] + p(x, t, \tau),$$
Then, according to the well-known theory (see [5], p. 234), we embed these terms in the space $U$ may not belong to space $U$. Indeed, taking into account the form (14) of the function $y = y(x, t, \tau) \in U$, we will have

$$Z(x, t, \tau) \equiv G(x, t, \tau) + \frac{\partial y}{\partial x} = \frac{g(x)}{2} \left( e^{\tau_1} + e^{\tau_2} \right) \left[ y_0(x, t) + \sum_{i=1}^{3} y_i(x, t)e^{\tau_i} + \sum_{2 \leq |m| \leq N_z} y^m(x, t)e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_z} y^{e_1+m}(x, t)e^{(e_1+m, \tau)} \right] =$$

$$= \frac{g(x)}{2} y_0(x, t) \left( e^{\tau_1} + e^{\tau_2} \right) + \frac{3}{2} \sum_{i=2}^{3} \frac{g(x)}{2} y_i(x, t) \left( e^{\tau_1+\tau_2} + e^{\tau_1+\tau_2} \right) + \frac{g(x)}{2} \left( e^{\tau_1 + e_1} + e^{\tau_2 + e_1} \right) \left[ \sum_{2 \leq |m| \leq N_z} y^m(x, t)e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_z} y^{e_1+m}(x, t)e^{(e_1+m, \tau)} \right] + p(x, t, \tau).$$

Here are terms with exponents

$$e^{\tau_1+\tau_2} = e^{(m, \tau)}|_{m = (0, 1, 1)}; \quad e^{\tau_1+\tau_2} = e^{(m, \tau)}|_{m = (0, 2, m_3)}, \quad e^{\tau_1+\tau_2} = e^{(m, \tau)}|_{m = (3, 1, 2)}, \quad e^{\tau_1+\tau_2} = e^{(m, \tau)}|_{m = (3, 2, m_3)}.$$ 

do not belong to space $U$, since in multi-index $m = (0, m_2, m_3)$ of the space $U$ must be $m_2 \neq m_3, m_2 + m_3 \geq 1$. Then, according to the well-known theory (see [5], p. 234), we embed these terms in the space $U$ according to the following rule (see (§)):

$$e^{\tau_1+\tau_2} = 1, \quad e^{\tau_1+\tau_2} = 1 \left( m_2 + 1 = m_3, \quad m_2 \neq m_3 \right), \quad e^{\tau_1+\tau_2} = 1 \left( m_3 + 1 = m_2, \quad m_2 \neq m_3 \right), \quad e^{\tau_1+\tau_2} = e^{\tau_1+\tau_2|1+1|} = e^{\tau_2}.$$ 

In $Z(x, t, \tau)$ need of embedding only the terms

$$M(x, t, \tau) \equiv \sum_{i=2}^{3} \frac{g(x)}{2} y_i(x, t) \left( e^{\tau_1+\tau_2} + e^{\tau_1+\tau_2} \right) + \frac{g(x)}{2} y_1(x, t) \left( e^{\tau_1+\tau_2} + e^{\tau_1+\tau_2} \right),$$

$$S(x, t, \tau) \equiv \frac{g(x)}{2} \left( e^{\tau_1} + e^{\tau_2} \right) \left[ \sum_{2 \leq |m| \leq N_z} y^m(x, t)e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_z} y^{e_1+m}(x, t)e^{(e_1+m, \tau)} \right].$$

We describe this embedding in more detail, taking into account formulas (**) :

$$M(x, t, \tau) \equiv \sum_{k=1}^{2} \frac{g(x)}{2} y_k(x, t) \left( e^{\tau_1+\tau_2} + e^{\tau_1+\tau_2} \right) + \frac{g(x)}{2} y_1(x, t) \left( e^{\tau_1+\tau_2} + e^{\tau_1+\tau_2} \right) =$$

$$= \frac{g(x)}{2} \left[ y_1(x, t)e^{\tau_1+\tau_2} + y_1(x, t)e^{\tau_1+\tau_2} + y_2(x, t)e^{\tau_1+\tau_2} + y_2(x, t)e^{\tau_1+\tau_2} \right] +$$

$$+ \frac{g(x)}{2} \left[ y_2(x, t)e^{\tau_1+\tau_2} + y_3(x, t)e^{\tau_1+\tau_2} + y_3(x, t)e^{\tau_1+\tau_2} \right] \Rightarrow$$

$$\Rightarrow M(x, t, \tau) = \frac{g(x)}{2} \left[ y_1(x, t)e^{\tau_1+\tau_2} + y_2(x, t)e^{\tau_1+\tau_2} + y_2(x, t)e^{\tau_1+\tau_2} + y_3(x, t)e^{\tau_1+\tau_2} \right].$$

(note that in $M(x, t, \tau)$ there are no members containing $e^{\tau_1}$ measurement exponents $|m| = 1$);

$$S(x, t, \tau) \equiv \frac{g(x)}{2} \left( e^{\tau_1} + e^{\tau_2} \right) \left[ \sum_{2 \leq |m| \leq N_z} y^m(x, t)e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_z} y^{e_1+m}(x, t)e^{(e_1+m, \tau)} \right] =$$

60 Вестник Карагандинского университета
After embedding, the right-hand side of equation (16) will look like
\[
\Rightarrow \hat{S}(x, t, \tau) = \frac{g(x)}{2} \left[ \sum_{2 \leq |m| \leq N_z} y^m(x, t) \left( e^{\tau_z + (m, \tau)} \sigma_1 + e^{\tau_z + (m, \tau)} \sigma_2 \right) + \right. \\
\left. \sum_{1 \leq |m| \leq N_z} y^{e_1 + m}(x, t) \left( e^{(e_1 + m, \tau) + \tau_z} \sigma_1 + e^{(e_1 + m, \tau) + \tau_z} \sigma_2 \right) \right] \Rightarrow \\
\Rightarrow \hat{G}(x, t, \tau) = -\frac{\partial}{\partial x} \left[ y_0(x, t) + \sum_{i=1}^{3} y_i(x, t) e^{\tau_i} + \sum_{2 \leq |m| \leq N_z} y^m(x, t) e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_z} y^{e_1 + m}(x, t) e^{(e_1 + m, \tau)} \right] + \\
+ \hat{M}(x, t, \tau) + \hat{S}(x, t, \tau) + R_1 y(x, t, \tau) + p(x, t, \tau),
\]
moreover, in \( \hat{S}(x, t, \tau) \) the coefficient at \( e^{\tau_z} \) do not depend on \( y_1(x, t) \). As indicated in [5], the embedding \( G(x, t, \tau) \rightarrow \hat{G}(x, t, \tau) \) will not affect the accuracy of the construction of asymptotic solutions of problem (2), since \( \hat{Z}(x, t, \tau) |_{\tau = \psi(x)/\varepsilon} \equiv Z(x, t, \tau) |_{\tau = \psi(x)/\varepsilon} \).

We show that the problem (9) has the unique solution in the space \( U \) if (16) is satisfied.

**Theorem 2.** Let the conditions (i)-(iv) take place and the right-hand side
\[
h(x, t) = h_0(x, t) + \sum_{i=1}^{3} h_i(x, t) e^{\tau_i} + \sum_{2 \leq |m| \leq N_z} h^m(x, t) e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_z} h^{e_1 + m}(x, t) e^{(e_1 + m, \tau)} \in U
\]
satisfy the condition (13). Then the problem (9) is uniquely solvable in the space \( U \) under the additional condition (16).

**Proof.** To use the condition (16), we calculate the expression
\[
-\frac{\partial}{\partial x} \left[ y_0(x, t) + \sum_{i=1}^{3} y_i(x, t) e^{\tau_i} + \sum_{2 \leq |m| \leq N_z} y^m(x, t) e^{(m, \tau)} + \sum_{1 \leq |m| \leq N_z} y^{e_1 + m}(x, t) e^{(e_1 + m, \tau)} \right] + \\
+ \hat{M}(x, t, \tau) + \hat{S}(x, t, \tau) + \sum_{i=1}^{3} \left[ (I_0^0 (K(x, t, s) y_i(s, t)))_{s=x} - (I_0^0 (K(x, t, s) y_i(s, t)))_{s=x_0} \right] + \\
+ \sum_{1 \leq |m| \leq N_z} \left[ (I_0^m (K(x, t, s) y^m(s, t)))_{s=x} - (I_0^m (K(x, t, s) y^m(s, t)))_{s=x_0} \right] + \\
+ \sum_{1 \leq |m| \leq N_z} \left[ (I_{e_1 + m}^0 (K(x, t, s) y^{e_1 + m}(s, t)))_{s=x} - (I_{e_1 + m}^0 (K(x, t, s) y^{e_1 + m}(s, t)))_{s=x_0} \right] + \\
+ p(x, t, \tau),
\]
therefore (16) takes the form
\[
-\frac{\partial}{\partial x} (\xi(x, t)) + K(x, t, x) \lambda_1(x) \xi(x, t) + p_1(x, t) e^{\tau_1} + p_0(x, t) = 0.
\]
where \( q(x, t) = \int_{x_0}^{x} \lambda^{-1}(s)K(s, t, s)ds \). Hence, under the conditions of Theorem 2, the solution (14) in the space \( U \) is uniquely determined.

Applying theorems 1 and 2 to iterative problems (we construct the series \((8_0)\), with coefficients in the class \(U\). Let \( y_{\varepsilon,N}(x, t) = \sum_{k=0}^{N} \varepsilon^k y_k (x, t, \psi(x, \varepsilon)) \) be the restriction of the \( N\)-th partial sum of this series at \( \tau = \psi(x, \varepsilon) \).

As well as in [2], it is not difficult to prove the following

**Theorem 3.** Let the conditions (i)-(iv) be satisfied. Then for \( \varepsilon \in (0, \varepsilon_0] \), where \( \varepsilon_0 > 0 \) is sufficiently small, the problem (1) has the unique solution \( y(x, t, \varepsilon) \in [x_0, X] \times [0, T] \), and the estimate

\[
\|y(x, t, \varepsilon - y_{\varepsilon,N}(x, t))\|_{C([x_0, X] \times [0, T])} \leq C_N \varepsilon^{N+1} \quad (N = 0, 1, 2, \ldots),
\]

takes place, where the constant \( C_N > 0 \) does not depend on \( \varepsilon \in (0, \varepsilon_0] \).

3 Construction of the solution of the first iteration problem in space \( U \)

Theorem 1, we will try to find a solution to the first iteration problem \((8_0)\). Since the right side \( h(x, t) \) of the equation \((8_0)\) satisfies condition (13), this system has (according to (14)) a solution in space \( U \) in the form

\[
y_0(x, t, \tau) = y^{(0)}_0(x, t) + \alpha_1^{(0)}(x, t)\varepsilon^{\tau_1},
\]

where \( y^{(0)}_0(x, t) \) is the solution of the integrated equation

\[
y^{(0)}_0(x, t) = \int_{x_0}^{x} \left( -a^{-1}(x)K(x, t, s) \right) y^{(0)}_0(s, t)ds - a^{-1}(x)h(x, t),
\]

where \( \alpha_1^{(0)}(x, t) \in C^\infty [x_0, X] \times [0, T] \) are arbitrary functions. Subjecting (17) to the initial condition \( y_0(x_0, t, 0) = y^0 \), we will have

\[
y^{(0)}_0(x_0, t) + \alpha_1^{(0)}(x_0, t) = y^0 \iff \alpha_1^{(0)}(x_0, t) = y^0 + a^{-1}(x_0)h(x_0, t).
\]

To fully compute the functions \( \alpha_1^{(0)}(x, t) \), we proceed to the next iteration problem \((8_1)\). Substituting into it the solution (14) of the equation \((8_0)\) we arrive at the following equation:

\[
L y_1(x, t, \tau) = - \frac{d}{dx} y^{(0)}_0(x, t) - \frac{d}{dx} \left( \alpha_1^{(0)}(x, t) \right) e^{\tau_1} + \frac{g(x)}{2} (e^{\tau_2} \sigma_1 + e^{\tau_3} \sigma_2) \left( y^{(0)}_0(x, t) + \alpha_1^{(0)}(x, t) e^{\tau_1} \right) + \frac{K(x, t, x_0) \alpha_1^{(0)}(x, t)}{\lambda_1(x)} e^{\tau_1} - \frac{K(x, t, x_0) \alpha_1^{(0)}(x_0, t)}{\lambda_1(x_0)} e^{\tau_1},
\]

(here we used the expression (5_1) for \( R_1 y(x, t, \tau) \) and took into account that for \( y(x, t, \tau) = y_0(x, t, \tau) \) only the terms with \( e^{\tau_1} \) remain in the sum (5_1)). It is not difficult to see that the right side

\[
H(x, t, \tau) = - \frac{d}{dx} y^{(0)}_1(x, t) + \frac{d}{dx} \left( \alpha_1^{(0)}(x, t) \right) e^{\tau_1} + \frac{g(x)}{2} (e^{\tau_2} \sigma_1 + e^{\tau_3} \sigma_2) \left( y^{(0)}_1(x, t) + \alpha_1^{(0)}(x, t) e^{\tau_1} \right) +
\]

62 Вестник Карагандинского университета
Asymptotic solutions of scalar integro-differential...

\[
\frac{d}{dx} \left( \alpha_1^{(0)}(x,t) \right) + \frac{K(x,t,x_0)}{\lambda_1(x)} \alpha_1^{(0)}(x_0,t) = 0.
\]

of equation (18) belongs to space \( U \). Equation (18) is solvable in this space \( U \) if and only if condition (13) are satisfied, which in our case take the form

\[
\frac{d}{dx} \left( \alpha_1^{(0)}(x,t) \right) + \frac{K(x,t,x_0)}{\lambda_1(x)} \alpha_1^{(0)}(x_0,t) = 0.
\]

Attaching to this system the initial conditions \( \alpha_1^{(0)}(x_0,t) = y^0 + a^{-1}(x_0)h(x_0,t) \), we find uniquely functions

\[
\alpha_1^{(0)}(x,t) = \alpha_1^{(0)}(x_0,t) \exp \left\{ \int_{x_0}^{x} \frac{K(s,t,s)}{\lambda_1(s)} \, ds \right\},
\]

therefore, we uniquely calculate the solution (17) of the problem (9) in the space \( U \). Moreover, the main term of the asymptotic of the solution to problem (2) has the form

\[
y_{x0}(x,t) = y_0^{(0)}(x,t) + \alpha_1^{(0)}(x_0,t) \exp \left\{ \int_{x_0}^{x} \frac{K(s,t,s)}{\lambda_1(s)} \, ds \right\} e^{\frac{1}{2} \int_{x_0}^{x} \lambda_1(\theta) \, d\theta},
\]

where \( \alpha_1^{(0)}(x_0,t) = y^0 + a^{-1}(x_0)h(x_0,t) \), \( y_0^{(0)}(x,t) \) is the solution of the integrated system \( y_0^{(0)}(x,t) = \int_{x_0}^{x} (-a^{-1}(x)K(x,t,s))y_0^{(0)}(s,t) \, ds - a^{-1}(x)h(x,t) \).

1 Фещенко С.Ф. Асимптотические методы в теории линейных дифференциальных уравнений / С.Ф. Фещенко, Н.И. Шкиль, Л.Д. Николенко. — Киев: Наук. думка, 1966. — 261 с.

Асимптотические решения скалярных интегро-дифференциальных уравнений с частным производным и с быстро осциллирующими коэффициентами

Статья посвящена разработке алгоритма асимптотического интегрирования задачи Коши для сингулярно возмущенного интегро-дифференциального уравнения в частных производных с быстро осциллирующими коэффициентами, описывающими различные физические процессы в микронеоднородных средах. Это направление в теории уравнений с частными производными интенсивно развивается и находит многочисленные применения в радиофизике, электротехнике, теории фильтрации, теории фазовых переходов, теории упругости и других разделах физики, механики и техники. Для исследования таких процессов обычно используются асимптотические методы. Известно, что быстро развивающиеся в настоящее время численные методы не исключают асимптотических. Это происходит по ряду причин. Во-первых, разумно построенная асимптотика, особенно ее главный член, несет существенную для приложений информацию об качественном поведении решения и в этом смысле в определенной мере заменяет точное решение, которое чаще всего не может быть найдено. Во-вторых, как это следует из сказанного выше, знание структуры решения помогает при разработке численных методов решения сложных задач, поэтому развитие асимптотических методов способствует развитию численных методов. Произведена регуляризация задачи, доказана нормальная и однозначная разрешимость общих итерационных задач.

Ключевые слова: сингулярное возмущение, дифференциальное уравнение с частными производными, регуляризация, асимптотичность решений.
